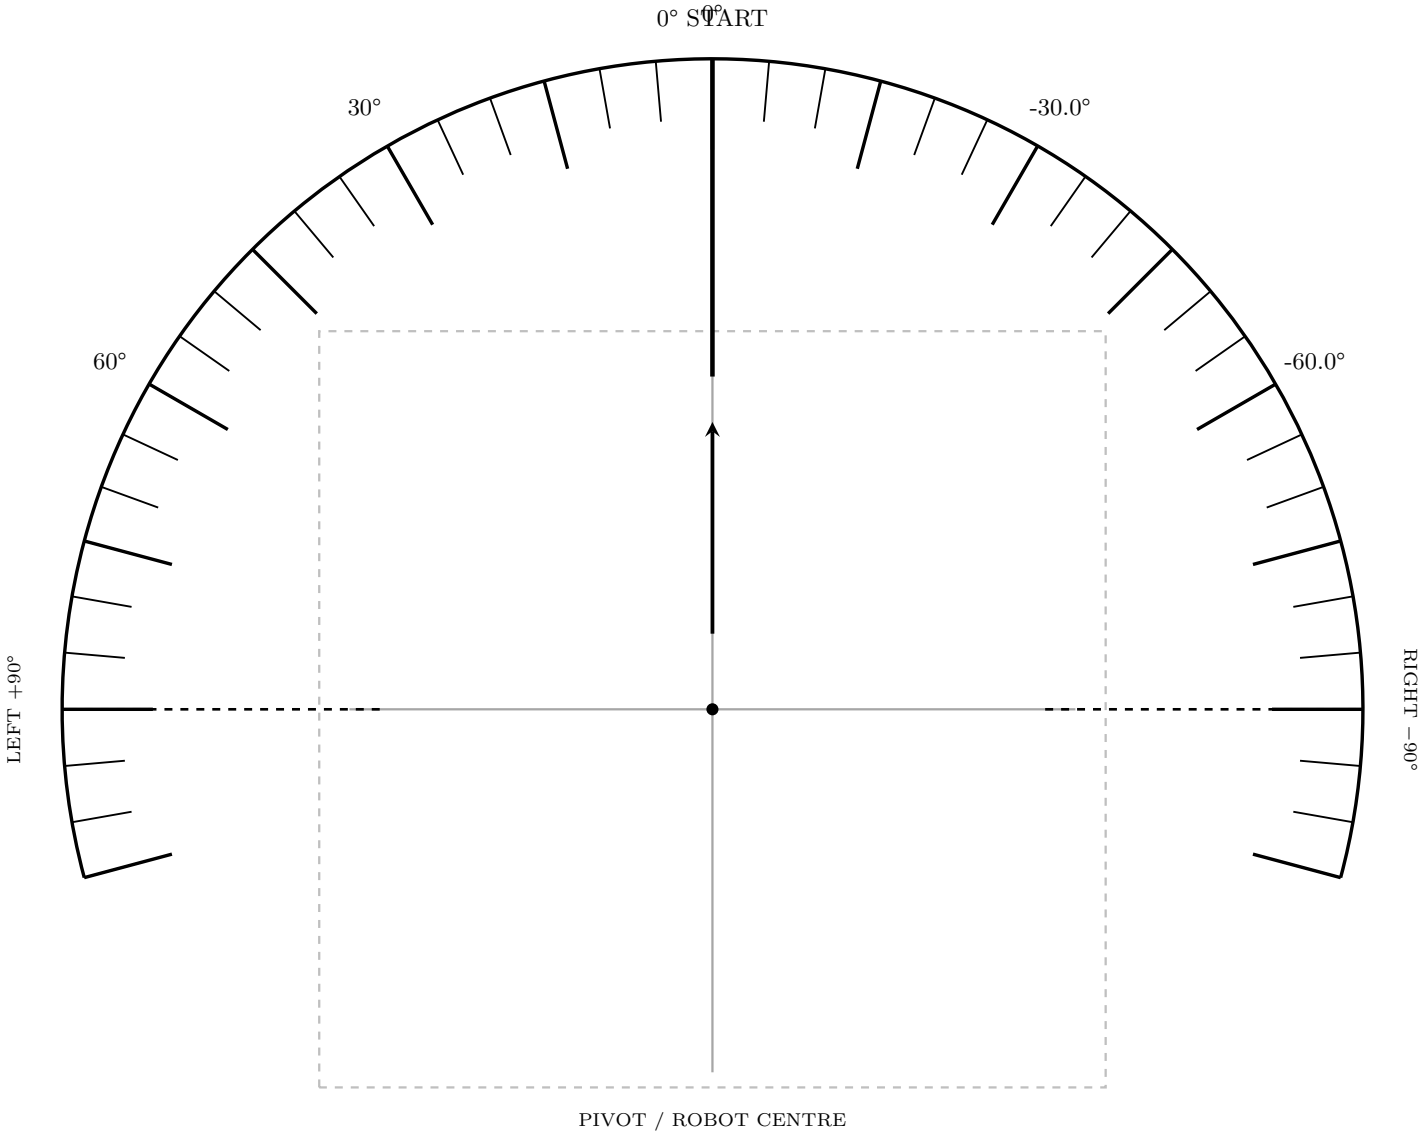
ODOMETRY 90° TURN — ANGLE REFERENCE SHEET

Print on A4 at 100% scale (disable fit-to-page). Tape the sheet flat to the desk. Place the robot centred on the cross, facing 0° (up). Press the button once. After it stops, read the final heading where the robot's centreline crosses the arc. Ticks are 5°; major labels every 30°.



Notes. Read the angle at the end of the robot's centreline, using the ticks outside the robot body. The expected 90° references are the two dashed rays. A reading of, for example, 94° means the robot physically over-rotated by 4° relative to the intended junction turn. The sheet does not guide the robot; it is only an independent visual reference for the final heading.
